Energy / Utilities

Results

- 30% improvement in productivity.
- A substantial reduction in overtime.

Opportunity

A leading UK energy company sought to improve the customer experience, reduce its cost-to-serve, and become a top-ranked utility company in the UK. With more than 10,000 staff serving 6.5 million households and businesses across the UK, this was an ambitious endeavor.

The energy company initiated a Customer Transformation Program (CTP), which had three main work streams: Leadership and Development, Operational Excellence, and End-to-End Customer Journeys. One of the key areas identified for improvement was workflows in the back office. The organization realized it needed to provide real-time information to all levels of management to monitor and improve productivity against customer demands and operational efficiency.

Solution

The energy company selected Verint Operations Manager and Verint operational management processes because the solutions provided not only the right technology, but also the consultative support needed to ensure incorporation of best practices within its operations. In particular, Verint Operations Manager provided three key capabilities:

- Strategic planning and forecasting;
- Real-time work management; and
- Reporting and analytics.

Verint operational management processes training gave the energy company a best practice management framework to coach and challenge managers to better understand workloads and balance these with the resources available. The framework ensured that the learning gained became practice and that the required activities and behaviors cascaded through the organization to deliver real impact.

Benefits

With Verint Operations Manager, the energy company was able to:

- Identify spare, short-term capacity across business functions;
- Quantify the volume of work;
- Gain real-time visibility into outstanding work; and
- Clear backlogs and meet SLAs.

* Solution formerly known as Work Manager.

“Thanks to Verint Operations Manager, agents are able to provide accurate real-time information on the status of customer enquiries. This enables us to better manage customers’ expectations of their end-to-end journey, and has helped us improve the overall customer experience.”

– Senior Operational Manager, Major UK Energy Company

The organization now has a tangible skills matrix in place to aid skills utilization, resulting in more effective multi-skilling across sites according to business needs. The energy company is now able to share resources across functions more effectively, completing work much quicker than before. For example, in one department, work is being completed in a record-breaking time of 2.1 days versus the previous four days.

Investing in training and coaching team managers resulted in consistency in the management of work, resources, and performance across the business. The framework promotes improved communication, enabling staff and managers to fully understand the wider context of what they were doing. In turn, the business has seen a shift from a “siloesd” workforce to a “team of teams.”

The energy company’s target was to increase productivity by 20 percent while maintaining the same workloads and resources. The actual benefit realized was 30 percent improvement in productivity, while also reducing overtime.

The visibility into workload and activity status not only helped the company improve operational efficiency, but customer experience as well. Because requests in the back office are completed faster, front-line agents are now able to answer customer status enquiries in a timelier manner. In addition, increased productivity enabled staff to focus on other customer improvement initiatives.
